## DESCRIPTION

The submersible SCLK aerator is a new aeration system for the wastewater treatment plants working through a submersible gearmotor. The possibility to use a double-speed motor enables the machine to work as a mixer too, thus maintaining a correct water moving without air feeding, which is very useful during some purification stages.

## OPERATION

The aerator consists of an impeller directly connected to the gearmotor shaft, and a diffuser equipped with supports, radial channels and intake duct for the connection of the proper intake pipe or hose. The pressurized fine-bubbled air is radially distributed and diffused in a water flow, thanks to the low rotation speed of the impeller.

## APPLICATION

The SCLK aerators are especially well-suited for deep basins and high oxygen transfer demands, in the following processes: oxidation, sludge stabilization, flotation, ozonation. The ease of installation afforded by these aerators means that tanks do not have to be emptied. The yield rates achieved and the low energy consumption are constant over time and are not influenced by coggings.

## INSTALLATION

The SCLK aerators are positioned on the bottom of the basin and stand firm due to their own weight. The air suction pipe or hose is connected above the water level either to the basin edges or to a gangway. The blower, or compressor, is installed under a soundproof hood or in a room of the plant premises. It is advisable to use one blower per aerator, or eventually for several aerators, with a derivation tube for each machine. The SCLK can be lifted out of the tank, after disconnection of the suction pipe, by means of a mobile crane.

## PERFORMANCE

In the classical aeration systems, the air reduction means a less efficient mixing. On the contrary, the SCLK represents a unique characteristic of its kind: with a double-polarity motor, it may supply a perfect mixing even without air. The SCLK aeration system guarantees low energy consumption with optimal loads. The system maintains the correct oxygen level and a suitable energy consumption by balancing the air flow and the impeller rotation speed, even on any individual aerator in the basin by using frequency inverters.

## ACCESSORIES

All aerators are supplied with the following accessories:

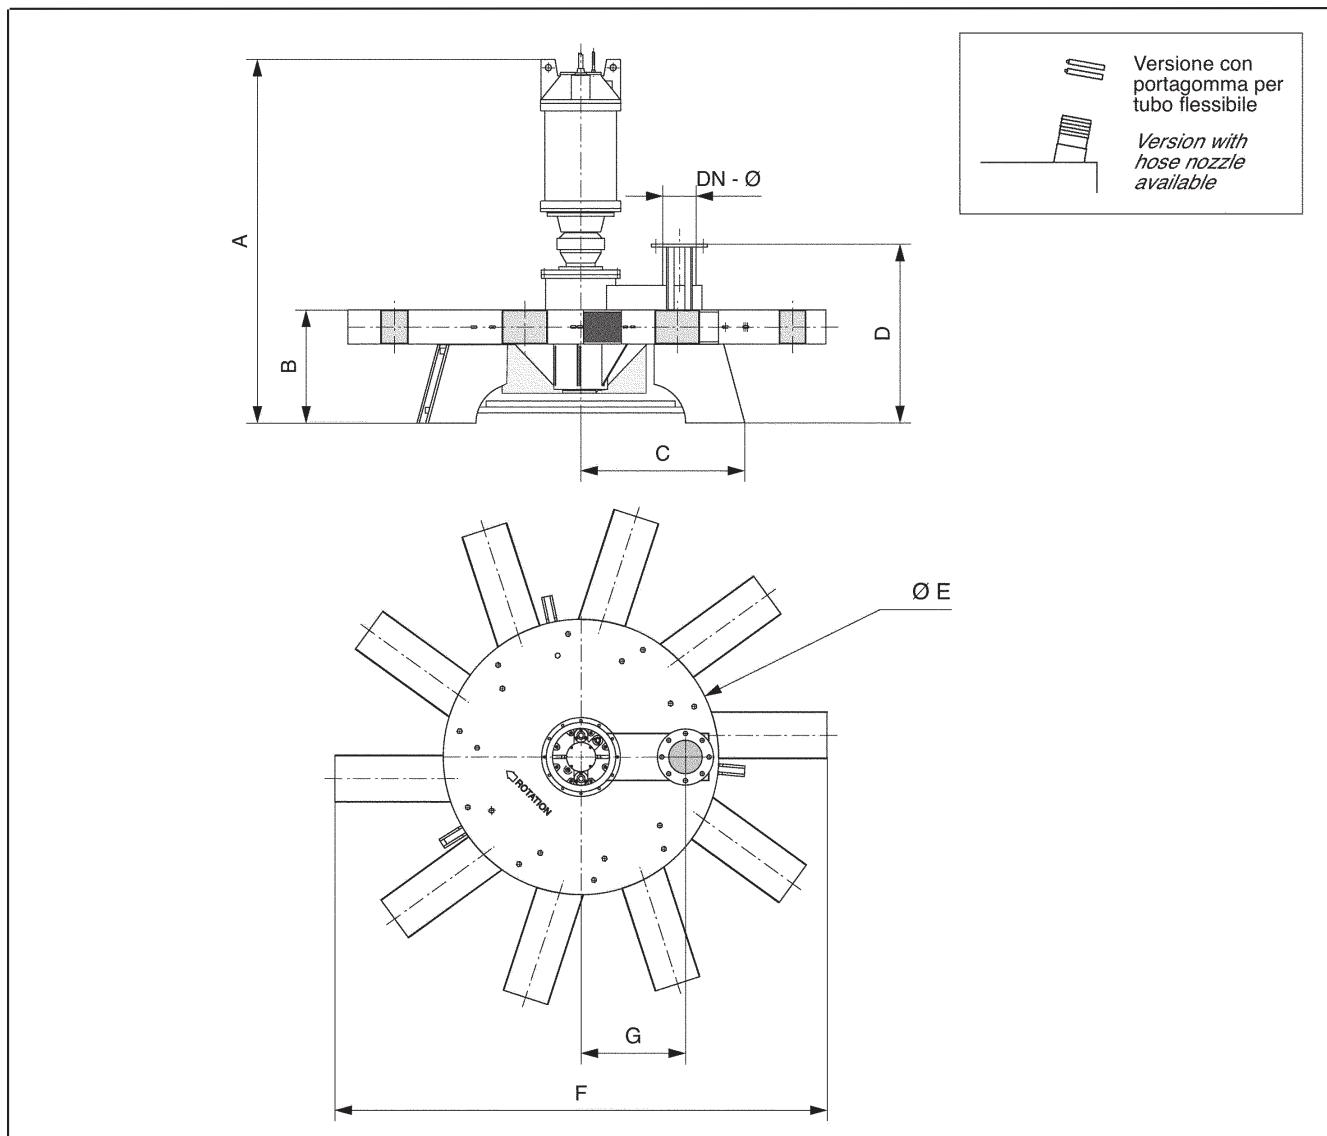

- 10 meters of electrical wire;
- humidity probe into the oil chamber;
- thermal protections.

For a correct installation, the following accessories are also available:

- stainless steel intake pipe AISI 304, or hose;
- rope fixing hook for the intake pipe;
- stainless steel rope AISI 304;
- detection relay for humidity probe into oil chamber;
- external motor protection relay.

## DYNAMIEK IN VLOEISTOFTECHNIEK

- Deskundig advies
- Een klantgerichte organisatie welke zich aanpast aan de eisen en wensen van uw organisatie
- Innovatieve en maatwerk oplossingen
- Breed assortiment vloeistofpompen van gerenommeerde merken
- Meer dan 5.000 pompen en 20.000 onderdelen op voorraad
- Een snelle en passende oplossing voor al uw vraagstukken
- Wij zien het belang in van uw processen en de continuïteit van uw bedrijfsvoering
- Snelle reactie- en levertijden
- Een eigen Technische Dienst met uitgebreide testfaciliteiten, werkend vanuit onze eigen werkplaats of bij u op locatie
- Reparatie, onderhoud en revisie van alle soorten en merken vloeistofpompen
- Storingsdienst 24 uur per dag, 7 dagen in de week
